

Clarity, in your hands.

A fresh HIVE interface grounded in Honeybee Brand Kit v3.0. Calm structure, confident type, and one visible next step.

Home / What needs attention

Requests / What is needed

Detail / Who owns the next step

The work is the focus.

Readable lists and a stable frame. The visual redesign uses the data and actions already present in the native app.

A confident frame

The HIVE mark and five familiar destinations live on soft black. Warm paper gives the actual work room to breathe.

Clear reading order

Case or request title first. Then the status, attention item, named next action, owner, and the source dates.

Fewer containers

Thin rules separate items. Reserve a filled panel for a warning or protected state. Home case rows remain read-only.

Full content remains available

These are viewport crops. Home continues to its remaining fields and Refresh control. Requests scrolls to recorded-through and Refresh.

A detail view you can read quickly.

Status, explanation, and responsibility stay together. Activity remains a concise record of roles and dates.

Useful detail, no new workflow

The existing request title and body carry the page. Keep the current Back to requests action and route behavior.

A quiet activity list

Show the existing event label, acting role, and server date. A dot supports the sequence; the words carry meaning.

Honest freshness

Use the existing recorded-through timestamp. Refresh remains an explicit user action. Do not add live, synced, or automatic labels.

Respect this app milestone

Do not introduce upload, reply, edit, approve, financial metrics, or document previews through this visual refresh.

The same care, on every screen.

Sign-in, Help, and Account inherit the same typography, spacing, surfaces, and control states.

Sign-in / Authorized email + code

Help / Existing text, available offline

Account / Existing access controls

Dark mode is designed, too.

Respect the device theme. Keep the same hierarchy and labels, with independently checked foreground and background pairs.

Soft black, not pure white glare

Warm Paper is the primary reading color. Sage is secondary text on dark only. Deep Black keeps the navigation distinct.

Honey stays selective

Use honey for the active destination and primary action on dark. On paper, actions use Soft Black and Warm Paper.

Measured text contrast

Paper / Soft Black	16.63 : 1
Sage / Soft Black	8.10 : 1
Soft Black / Honey	11.24 : 1
Honey Ink / Paper	6.91 : 1
Muted Copy / Paper	5.89 : 1

A small system. A cohesive app.

One family, a disciplined scale, semantic colors, and consistent controls. These are proposed native component specifications.

Manrope

Aa 0123456789

Screen title	32 / 38 · 700
Section heading	22 / 28 · 700
Body + form value	16 / 24 · 400 / 500
Control label	16 / 20 · 700
Metadata	14 / 20 · 500

4 · 8 · 12 · 16 · 24 · 32 · 48

Spacing follows a shared 4/8 rhythm. Screen gutter 24, compact width 16. Primary controls 52 high. Panels 16 radius; inputs square; actions pill-shaped.

12 functional colors

 Soft Black #111310	 Deep Black #0B0C0A	 Warm Paper #F3F2EA
 Warm Canvas #E7E6DD	 Honey Gold #E8C655	 Soft Honey #F2DA82
 Sage #A6ADA0	 Soft Moss #D7D9CF	 Honey Ink #684F00
 Muted Copy #5B5E55	 Error #9D3E25	 Success #365B2B

Comfortable. Legible. Responsive.

Minimum 48 × 48 native targets. Visible focus. No color-only state. Text wraps at large sizes. Motion is brief and optional.

A focused implementation for Claude.

Start with the shared system, prove the first screens, then propagate it. Keep the current native app architecture.

1. Align the sources

Use v3.0 and the approved HIVE honeycomb. Archive v2 references as superseded. Native branch reviewed: ca961818b68321791ab8b8de4b0bd345bb428999.

2. Restyle the shared layer

Update hive-app/src/ui/tokens.ts, the seven primitives, theme pairing, PrimaryNav, and app.json. Add local Manrope loading and approved logo assets.

3. Prove Home + Requests

Implement both themes, request detail, long lists, text scaling, and every data/auth state. Preserve handlers, route guards, client scope, and stable test IDs.

4. Extend the proven system

Apply the same rules to Activity, Help, Account, scope selection, sign-in, code entry, and every auth recovery state. Preserve existing copy unless explicitly scoped.

Acceptance before release

- 01** Exact HIVE asset loads. No substituted bee, broken URL, stretching, or recreated mark.
- 02** Light and dark contrast, focus, wrapping, 320-width layout, largest text, and safe areas pass.
- 03** Loading, empty, offline, retry, revoked access, and unsafe session storage remain distinct.
- 04** No cross-workspace flash, stale cached record, unsafe retry, new data write, or telemetry payload.
- 05** Existing unit, integration, isolation, and navigation checks pass on the actual implementation.
- 06** Kody reviews technical evidence; Stacie reviews client-facing feel. Exact store release is separately approved.

Design proposal for implementation

This PDF is a visual reference. It is not a running app, an implemented change, or release evidence.
